JAVASCRIPT TOOLS JAVASCRIPT TOOLS JavaScript is the dynamic scripting language for Web pages. An internet browser with JavaScript enabled will be able to process or execute much of the JavaScript embedded in an HTML document. The developer of the document usually puts the JavaScript in the HEAD section of the document to ensure that it is processed as the page is retrieved from the web.
ISLAMABAD: Senior US diplomats — including the acting deputy secretary of state — advised Pakistan's leadership not to welcome back Osama bin Laden's son, OBL Hamza, to Pakistan in 2014, documents leaked by Edward Snowden show. This advice was ignored, and Hamza bin Laden returned in the autumn of 2014, according to documents published by the WikiLeaks website. OBL Hamza (L) with Osama Bin Laden The documents were obtained by The Intercept and reveal that as far back as 2013, the US told Pakistan's government that it was not a good idea to

What's New In Office ActiveX?

ActiveX is a Microsoft technology that was introduced in Internet Explorer 4.01 (released on March 4, 2001). ActiveX is an OLE 2.0 control that is executed within an Internet Explorer browser that runs an ActiveX application. ActiveX controls are programmed in the .NET Framework, such as VB and C#, as well as with the classic Visual Basic language. My experience is that if you are making Office 2007 Applications, the VSTO supports Office 2007 and will allow you to insert Microsoft Office-based logic. If you use Office 2010 you will have to use the Office Add-In for 2010 instead. IF you have an app designed in Office 2007 but using Office Open XML you would be best off using the Add-In but if you want to use an ActiveX control then no matter what version of Office you use you will need to use an Office COM server version or greater (i.e. 7.0). You can also have 2 or more versions of Office open at the same time. There are also some third-party COM servers that can add ActiveX controls to Office files. For Office 2007, use version 15.0 or greater. For Office 2003 and Office 2000, use version 12.0 or greater. For Office 2000, use version 9.0 or greater. Office Open XML is Microsoft's extension of the Office Open XML file format to support structured documents and Office 2007 applications, replacing the Office Binary file format. This specification is available at for the latest version and for the previous versions. The Office Open XML file format uses elements similar to those in Office 2007,

Office 2003, and Office 2000. It includes new elements, attributes, and other elements that specify the text, structure, formatting, style, and content of the documents. The specification also includes data items that describe content, and elements that control how the content in the file is interpreted and displayed. Office Open XML file format is based on XML, and the specification uses XML namespace definitions. The latest version of Office Open XML includes the Open XML File Format SDK. VSTO also supports the OOXML files and in some cases more than the OOXML. Hope this helps you. If you have any other question, just feel free to ask. Regards, Best Regards, AICong Who is online
