These include: Defining 2D and 3D spaces and objects Drawing free-form shapes Drawing graphic and technical (engineering) drawings Placing solids and texturing Creating legends and annotations Add and manage objects to sheets Viewing and printing 2D and 3D models Creating components Creating and editing a wide range of drawings and drawings with annotations Creating and editing drawings and drawings with annotations Tutorial for beginners While not being the only CAD system, AutoCAD is by far the most widely used and has a significant installed base. AutoCAD can be used on virtually any computer platform with either Microsoft Windows (from Windows 7 upwards) or Linux. There is also a choice of systems for which you can receive support and updates directly from Autodesk. AutoCAD is a Windows-only product, but it can work perfectly well on a Mac. The initial protocol has recently been completed. Of those assigned to one of the four treatment conditions, over 85% of the smokers have successfully maintained abstinence for at least 8 weeks (average abstinence=13.3 weeks). The study's success in achieving this level of abstinence suggests that the dose and duration of treatment offered to the intervention groups (prolonged exposure, a brief smoking reduction procedure, and a self-help cognitive-behavioral treatment) were appropriate for this population. The continuation seeks to assess the long-term efficacy of these treatments compared to a waiting list control, and to determine whether more intensive treatments (e.g., briefer exposure or medication treatments) are more effective than less intensive ones. The study also seeks to compare the relative efficacy of the interventions by assessing their treatment effects on those smokers with mild and moderate nicotine dependence (as defined by Fagerstrom), and among African Americans and other racial minorities. The continuation trial is not planned to assess the efficacy of pharmacotherapy or the relative efficacy of alternative pharmacotherapy agents. The four interventions will be delivered in a 2 x 2 factorial design, with subjects randomly assigned to one of two treatment conditions (active vs. waiting list) and one of two treatment intensity levels (intensive vs
