I noticed that the Id property for the tables is generated automatically as the IDENTITY method. Is there any way that I can customize this property instead of letting Entity Framework generate the Id property? A: It seems there is not any way that we can override the Id property to

use any of our own implementation. May be we can make use of the database initializer to specify that database initializer needs to be used to initialize the database table first. Please give it a try if it helps you in any way. Using a self-report measure of body image distaste (the body image sensitivity scale) to identify women who self-reported experiencing body size concerns. Theory suggests that health-threatening body size concerns, such as body image distaste and negative body image beliefs, should be linked to increased danger of eating disorders (ED) development. However, preliminary research suggests that rates of body image distaste and beliefs are relatively low in ED samples. The goal of the present study was to examine the prevalence of ED symptomatology in a community sample of women ($n = 590$) who completed a self-

report measure of body image distaste. Only one-tenth of the sample reported distaste for their bodies, which was associated with self-reported ED symptoms even after controlling for the covariates of BMI, age, and ethnicity. The present findings indicate that body image distaste is a relatively uncommon phenomenon in this community sample, and highlight the importance of addressing body size concerns during ED prevention interventions.

Q: Vim: How to change "s" flag in 'C/c' mode to "z" In most of the manuals (including this one) the 'C/c' flag is described as changing from cursor mode (usually "c") to visual mode (usually "z"). I find that with my vimrc set as below, it does not.

Create and integrate 3D models into Autodesk programs, such as AutoCAD, Inventor, BIM 360 and Fusion 360. Automate the process of modeling and drawing in preparation for 3D environment analysis and visualization, including importing and assigning materials to automatically break geometry into components and insert landmarks. Use existing 3D building data on which to base the model. Apply analysis and visualization tools in real-time. Work with any Autodesk building applications, including Blueprint, Progressive Builder and MXD. Automate repetitive tasks with comprehensive tools for managing files and automating processes. Support for GeoJSON in the enterprise edition allows for loading of non-Autodesk and external building data sources, such as Google Earth, ArcGIS Online, WMS services or

local GIS data. Use its robust workflow tool to manage multiple projects and collaborate across multiple users. To use the Autodesk InfraWorks, you will need the Autodesk building applications, such as AutoCAD, Inventor, Civil 3D, R14 or Fusion 360. It is also required to have the Autodesk InfraWorks AutoPilot and Autodesk InfraWorks Connectors. The Enterprise edition comes with the Autodesk InfraWorks AutoPilot, AutoPilot MDL and Autodesk InfraWorks Connectors. The Desktop edition comes with the Autodesk InfraWorks AutoPilot.

The Autodesk InfraWorks QZ-2 database is a fully licensed infrastructure modeling software that helps you create a data model for infrastructure projects from conceptual design to construction. With Autodesk InfraWorks, you can create a model for any kind of infrastructure projects such as bridges, tunnels, roads, drainage systems, watercourses, pipelines, rail systems, buildings, power plants, and other critical civil engineering projects. InfraWorks enables you to visualize the design and analyze it in several contexts and settings. It helps you create a realistic viewpoint for the project and explore the behavior of the project over time. The tool also includes a powerful data analysis capability and it can support different

types of data such as FEM, PDE, CAD, gridded datasets, raster, POI, GPS data, and images. The product was conceived to achieve a common goal of using a single tool for all the aforementioned components. This tool provides you a robust infrastructure modeling technology that helps you create infrastructure models that can be used for planning, design, visualization, and analysis. The tool employs an excellent data import and export functionality for data modeling. You can create new data sources by importing shapefiles and other GIS data into the tool. Moreover, you can export the model into various formats such as PBF, XG2, and A360. It also supports modeling of different types of components such as tunnels, major roads, bridges, tunnels, parking lots, buildings, railways, and drainage systems. A reliable infrastructure modeling tool, Autodesk

InfraWorks QZ-2 can be used with ArcGIS data models. Autodesk MapGuide is a GIS mapping application designed to interface with data on a variety of topics. With a familiar interface you can map and view any of the many dataset formats. Using tools for annotating maps and for exploring data, you can quickly plan new projects, research existing data or get a sneak peak at new trends.

Autodesk MapGuide Description: MapGuide is a software application designed to help you find, understand, and present data. MapViewer, the program's pan and zoom capability, enables you to view the data without necessarily having to scroll through large volumes of data. Instead, you can navigate the data directly by dragging the map or going to specific areas by clicking. You can access images, tables, and other data types and only need to worry about how to present the data. For

example, you can export the data to any vector

What's New In Autodesk InfraWorks?

Autodesk InfraWorks is a specialized tool designed to come to the aid of Building Information Modeling processes. While it is the closest thing to 3D visualization in civil engineering, you should know that the app serves a more important purpose, which is planning. Includes numerous options for conceptual design and context modeling By adding the ArcGIS connector to your models, you can create custom stylization and be able to use field applications at the same time. The large scale models can be created by aggregating the existing data with the aforementioned connector, but also with existing data from 2D, CAD, raster and 3D models. You can generate the terrain and features

from point clouds and expand the design with parcels, right-of-ways and easements. As far as the conceptual design features are concerned, you can count super-elevation, component roads, cross-section views, terrain contours and theme palettes, the latter allowing you to classify the assets based on their attributes. The project can be previewed in context so that you can further explore specific areas of interest. Comes with advanced analysis and simulation features In addition to creating the model, the app comes with features to help you explore its behavior in various real-world circumstances. Therefore, you can generate a flood simulation to identify potential risks based on the multiple water elevation changes over time and inflow locations, for instance. Moreover, you can create tests to find out how shadows may affect the design over time and calculate

earthwork quantities on multiple roads, areas of interest, right of way or a station range. You can also estimate the best handling of materials and measuring the horizontal and vertical distance and slope between any two points of the model. A reliable tool that can generate robust context models based on real data. If you are into civil engineering or other industries that entail uses real-data models to create optimal context models, then Autodesk InfraWorks enables you to conceptualize and visualize the infrastructure project in their natural environment. You can use it to create and edit surfaces, convert geometry from one file format to another, create new surfaces from a selection or all within your model space, and generate a mesh based on your existing elements. You can also apply materials to your model and paint over the entire model with vector

and color. Mesh Lab allows you to work with existing models and easily extract specific components from them. You can also join parts of meshes together to create a new surface. If you want to create
