Q: How to create a new key in a specific branch of a new object in a specific Git repository? I have a Git repository with three branches: master, develop and release. In my develop branch, I have some new objects. I want to create a new key in these objects (the key will be used to identify the object by other systems). How can I create this new key in the develop branch of my Git repository without affecting the master or release branches? A: You need to open the file (not commit) for that branch with VIM or something similar. To do that, you need to use another language with a text-editor: Perl, Ruby or even Python (eg Then you need to find the magic line in the file: $ git checkout develop Switched to branch 'develop' Then you need to replace the current line with another. You can also write your own function: #!/usr/bin/env perl use warnings; use strict; use git; my $branch = shift; my $file = shift; open my $fh, '; my $str = ""; foreach my $line (@lines) { if ($line =~ /^\s*$branch/) { $str = $str. $line; } } close $fh; print "$str "; exec("perl -ne 'if($line =~ /^\s*$branch/) {$line. " key";}'"); # Insert your own key. Please note that this is a small and basic implementation. Is there a relationship between the presence of a hypertrophic scar and changes in voice physiology?
