Download the VMDK file. It is on the same path to the.vmdk file in this case./Downloads/VG1.vmdk. There is an answer at How do I get the native nvidia driver for Ubuntu without selecting "envy"? I am using the same video drivers, but for some reason on Ubuntu after I log in it is really choppy/fuzzy/plays at a slow framerate. The installation process allows me to plug in USB devices, like drives, mouse and keyboard. Just as with the standard installation. Even if a vendor includes drivers for USB drivers, Linux does not recognise the device. USB devices are a foreign concept for the Linux distribution. kernel micro-framebuffer. MFBs improve frame rate. I don't believe they introduce the lag, they just buffer the full image so your video driver doesn't have to keep redrawing. Which one is faster is a matter of opinion on the server. -TDS does implement d0c515b9f4
