in his book, "the soul of a new machine," charles simonyi also argues for a hybrid design. a small team of engineers can develop the whole system in a very short time. in the early days, a large team of developers can develop a product with high quality. an intermediate team can take care of the transition between the two phases. and a large team can take care of the transition between the two versions.

the hybrid model can result in a product with both high quality and high performance. in the past, most software companies followed the latter model. with the rise of agile development, the hybrid model is gaining popularity, writes simonyi. data includes information on date registered, name and. address. data can be anonymized so that it cannot be linked to a specific individual. a name and address is a match when the same individual appears in both places. if there is only one match, the data is classified as single-record match. multiple matches are classified as multiple-record match. data anonymization is common in credit reporting, court records, and voting rolls. in security software, the majority of time is spent in matching data against a target. the target may be a person, an ip address, a host name, or a network. when possible, the software analyzes the data to make sure that the match is a match. when the match is for a specific person, the match is classified as a known-person match. each match is assigned a score. if there is a known-person match, the score is high. if there is a single-record match, the score is medium. if there are no matches, the score is low. the software can also be programmed to ignore data that does not match. this technique is also called negative data.
