Muhyadheen Mala Malayalam Pdf 141 Muhyadheen Mala Malayalam Pdf 141. njuessnteen02 'am engelsk ueberhaupt offizielle websites Muhyadheen Mala Malayalam Pdf 141 Muhyadheen Mala Malayalam Pdf 141 Thanks A: I had a similar problem when running on iOS 7 and the main culprit was the inline style attribute. When loading a site from the Internet, the meta viewport tag is not set, resulting in an auto-sized viewport. So a simple fix would be: wrap your mobile site in a separate tag, so that your page loads in full-width. or create a custom media-query if you can @media (max-width: 600px) { .notification_body { display: none; } } Q: Why is integral calculation for a moving surface much harder than a stationary surface? Given a surface, $\sigma(x,y,t)$, the line integral $\int_C \sigma \cdot \hat{n} \text{d}s$ is quite simple when C is a line, circle, ellipse, etc. However, when C is a moving surface, i.e., $C = \{(x(t), y(t)): t \in [t_1, t_2]\}$, then calculating the line integral $\int_C \sigma \cdot \hat{n} \text{d}s$ is very difficult. Here is a concrete example, when C is a circle of radius R and center (x_0, y_0) : $\int_C \sigma \cdot \hat{n} \text{d}s = \int_{\frac{R^2}{2}}^{\frac{R^2 + x_0^2 + y_0^2}{2}}$
