The robot will run on two 8v batteries. The idea is to control the motor through the PWM signal. Normally, I could use a microcontroller, but the robot runs on a low power microcontroller. I don't want to waste the excess capacity. simulate this circuit - Schematic created using CircuitLab A: Yes, but only if you provide the motor with "sine" instead of "square" wave. Sine wave should be sufficient to spin up the motor for a short period of time. Sine wave is more efficient (as in less power consumption) than square wave, so your motor will turn faster using sine than using square. In practice, the power consumption of your transistors is likely to be the limiting factor in the case of battery-powered device. Source: Wikipedia The owner of the company that supplied the name for the crypto-based crowdsale model, the Filecoin model, has warned that TokenFest, the virtual conference that brought together a who's who of the industry and will be held in London on March 11, could be a "target of fraudsters." Filecoin's largest investor, Blockstream and Binance CEO, Brandon Chez, announced in January that the upcoming conference would be an "IEO." He explained that an initial exchange offering (IEO), is an easier way to raise funds for a project and companies that are using it can raise up to 100,000 times more than those who go through an ICO. "Blockstream is proud to host the first-ever IEO conference, giving token sale participants the opportunity to learn about the benefits of the Filecoin model, TokenFest is the most exciting conference I've ever attended," Chez said in January.
